

## 13. Difference between println and print

Both the statements are used to print something in the console. The difference between those two statements is as follows:

### 13.1 System.out.println()

println() method in Java is also used to display a text on the console. This text is passed as the parameter to this method in the form of String. This method prints the text on the console and the cursor remains at the start of the next line at the console. The next printing takes place from the next line.

**Example Program:**

```
public class Concept
{
    public static void main(String[] args)
    {
        String a="Lokesh";
        String b="Mannem";
        System.out.println(a);
        System.out.println(b);
    }
}
```

**Output:**

```
Lokesh
Mannem
```

### 13.2 System.out.print()

print() method in Java is used to display a text on the console. This text is passed as the parameter to this method in the form of String. This method prints the text on the console and the cursor remains at the end of the text at the console. The next printing takes place from just here.

**Example Program:**

```
public class Concept
{
    public static void main(String[] args)
    {
        String a="Lokesh";
        String b="Mannem";
        System.out.print(a);
        System.out.print(b);
    }
}
```

**Output:**

```
LokeshMannem
```
